

**What powerful
greenhouse
gas is
produced
when organic
matter like
garden
cuttings are
thrown into
landfill?**

Methane, a greenhouse gas with 20 times the global warming capacity of carbon dioxide (CO₂), is produced when organic matter breaks down in landfill.

What can you do?

Reduce the amount of food that you buy and waste.

Use a worm farm, compost bin or bokashi bucket to turn organics into garden fertilizer.

If your council has a green (garden) waste collection get a bin and follow their guidelines for use.

Call your local council or visit their web site for more information about organics.

For info on kerbside collection and to find drop off locations for items ranging from computers, cartridges and mobiles to clothes, chemicals and corks
